

ASSIGNMENT 2

- **SESSION 1**

1. Open the homepage of Zomato or Flipkart in your browser and carefully review it for any visible errors, bugs, or defects (such as broken images, misaligned buttons, typos, or non-working links). List at least 3 issues you observe and describe why you think each one is a defect.

Ans :

Application tested : Zomato homepage

Browser : google chrome

Observations : Misaligned banner text.

Why it's a defect: The promotional text overlaps the banner image on smaller screens, making it difficult to read and reducing usability.

Observations : Broken promotional image.

Why it's a defect: One banner shows a missing image icon instead of the intended graphic, making the page look incomplete and unprofessional.

Observations : Non-working promotional link.

Why it's a defect: Clicking a promotional banner does not open the expected page, preventing users from accessing the advertised

2. Write a short explanation (2-3 sentences each) for the following:

What is the difference between an error, a bug, and a defect? Give one real-world example for each from any app you use daily (e.g., Instagram, Paytm, IRCTC)

Ans :

Difference between Error, Bug, and Defect :

Error :

An error is a mistake made by a person during software development, such as a developer writing incorrect code or a tester misunderstanding a requirement.

Example: A developer accidentally writes the wrong discount formula in a Paytm cashback feature.

Bug :

A bug is the flaw in the software caused by an error. It is discovered during testing or use.

Example: On Instagram, tapping the "Like" button sometimes causes the app to freeze.

Defect :

A defect is a bug that causes the software to behave differently from the expected requirement. It is usually identified during testing against specifications.

Example: In IRCTC, selecting "AC 3 Tier" books a different class instead of the one chosen.

3. Think of a recent time when an app you use (like WhatsApp, BookMyShow, or PhonePe) didn't work as expected. Identify the possible cause of the defect: was it a human error, a technical limitation, or a process gap? Explain your reasoning for each case.

Ans :

Example: PhonePe payment failure.

Possible cause: Technical limitation.

Reason: During peak transaction times, the bank server or payment gateway may be overloaded. The app functions correctly, but the backend infrastructure cannot process requests quickly enough, causing payment failures.

4. Imagine you are testing a new food delivery app (like Swiggy). List 3 types of risks that could affect the quality of the app before launch (for example: security risk, usability risk, performance risk). For each risk, briefly explain how it could impact users.

Ans :

Risks in a Food Delivery App :

1. Security Risk :

If user payment details are not properly protected, hackers could steal sensitive information, leading to financial loss and loss of trust.

2. Usability Risk :

If the interface is confusing or difficult to navigate, users may struggle to place orders and switch to competing apps.

3. Performance Risk :

If the app becomes slow during lunch or dinner hours, users may experience delays, abandoned orders, and frustration

5. You are given a mini project: a Movie Ticket Booking webpage.

Classify the following as either a defect or a risk: (a) The 'Book Now' button does not respond on mobile, (b) There is no logout option, (c)

The app sometimes loads slowly during IPL match days. Justify your answer for each.

Ans : Defect or Risk Classification

(a) The "Book Now" button does not respond on mobile.

Classification: Defect

Justification: This is an existing issue where a required feature is not working as expected, preventing users from booking tickets.

(b) There is no logout option.

Classification: Defect

Justification: If the requirements specify that users should be able to log out, the missing functionality is a defect because the application does not meet the expected behavior.

(c) The app sometimes loads slowly during IPL match days.

Classification: Risk

Justification: This is a performance risk caused by high traffic. It may not always occur, but it could negatively affect user experience during periods of heavy use.
