

ASSIGNMENT 2

- **SESSION 11**

1. any one feature from an app you use daily (for example: 'Search Restaurants' in Zomato or 'Add to Cart' in Flipkart) and break down the testing tasks for this feature using a Work Breakdown Structure (WBS) — list at least 6 distinct testing activities or sub-tasks.

Ans.

Feature Chosen: Add to Cart (Flipkart)

Work Breakdown Structure (WBS)

1.Requirement Analysis

Understand business requirements

Identify expected behavior

2.Test Planning

Define testing scope

Prepare test strategy

3 Test Case Design

Write positive test cases

Write negative test cases

Prepare boundary value test cases

4.Test Environment Setup

Configure test devices/browsers

Verify application build

5.Test Execution

Execute functional test cases

Execute UI validation

Verify cart updates

6. Management

Report defects

Retest fixed defects

7. Regression Testing

Ensure existing cart functionality is unaffected

Validate checkout flow

8. Test Reporting

Prepare test summary report

Record pass/fail status

2. For the 'Send Message' feature in WhatsApp, estimate the total test effort required by listing all the main test activities, assigning estimated hours to each, and calculating the overall effort needed.

Ans.

Test Activity	Estimated Hours
Requirement Analysis	2
Test Planning.	2
Test Case Design	5
Test Environment Setup	2
Test Execution	8
Defect Reporting & Retesting	4
Regression Testing	4
Test Summary Report	1
Total Effort	28 Hours

Total Estimated Test Effort:

28 Hours (approximately 3.5 working days, assuming 8 hours/day)

3. Given the following scenario: Flipkart's 'Apply Coupon' feature is being released as a small module. Using the steps of test effort estimation discussed in class, create a simple estimation sheet (table) showing each test activity, estimated hours, and any assumptions you make.

Ans.

Test Effort Estimation Sheet :- Flipkart "Apply Coupon" Feature

Assumptions :-

- Small module release
- Existing application is stable
- One tester is assigned
- Basic regression testing is required
- Around 20 test cases

<u>Test Activity</u>	<u>Estimated Hours</u>	<u>Assumptions</u>
Requirement Analysis.	1	Requirements are clear
Test Planning	1	Small feature
Test Case Design	3	Around 20 test cases
Test Environment Setup	1	Existing environment
Test Execution	4	negative testing
Defect Reporting & Retesting	2	Few defects
Regression Testing	2	Coupon should not affect
Test Report Preparation	1	Final report generation
Total Estimated Effort 15 Hours		

4. Read about Test Point Analysis (TPA) as introduced in class. In your own words, explain how TPA could help estimate testing effort for a new 'Movie Booking' feature in BookMyShow. List two advantages and one limitation of using TPA for this purpose.

Ans.

Test Point Analysis (TPA)

Explanation:

Test Point Analysis (TPA) is a technique used to estimate testing effort based on the size and complexity of the software. Instead of simply guessing the number of testing hours, TPA considers factors such as the number of functions, inputs, outputs, interfaces, and complexity of the feature.

For a new Movie Booking feature in BookMyShow, TPA would estimate testing effort by analyzing components such as:

- ❖ Movie selection
- ❖ Theatre selection
- ❖ Seat selection
- ❖ Payment process
- ❖ Booking confirmation
- ❖ Ticket generation

Advantages of TPA :-

1. Provides a more objective and structured estimation instead of relying only on experience.
2. Helps in better planning of resources and schedules by estimating effort based on feature complexity.

Limitation of TPA :-

- Requires detailed understanding of the system and feature complexity, making it difficult to apply accurately during the early stages of development
