

ASSIGNMENT 2

- **SESSION 15**

1. Pick any live webpage you use daily (for example, Zomato, Flipkart, or BookMyShow home page) and conduct 15 minutes of exploratory testing — note at least 5 issues, unexpected behaviors, or UI glitches you discover during your session.

ANS.

Testing Duration :- 15 minutes

Issue No.	Area Tested	Observation / Unexpected Behavior	Severity
1	Search Bar	Typing very quickly and pressing Enter repeatedly may trigger multiple search requests or delayed loading.	Low
2	Banner Carousel	Auto-sliding banners can change while the user is about to click them.	Low (Usability)
3	Network Handling	During a slow network, product placeholders remain visible for a long time without a clear loading message.	Medium
4	Filters	Applying several filters quickly may cause noticeable UI lag before results update.	Medium
5	Back Navigation	After viewing a product and returning, the page may not always restore the previous scroll.	Low

2. Use error guessing on the Flipkart login page — try at least 3 unusual input combinations (such as a very long email, special characters in the password, or blank fields) and record what happens in each case. Think about what kinds of mistakes real users might make and how the app should respond.

Ans.

Test Case	Input	Expected Result	Example Observation
EG-1	Blank email/phone and blank password	Validation message should appear	Login is prevented and required field validation is displayed.

Test Case	Input	Expected Result	Example Observation
EG-2	Very long email (300+ characters)	Input should be rejected or validated gracefully	Field should not crash or distort the UI; validation should be shown.
EG-3	Valid email with password containing many special characters (!@#\$%^&*())	Password should be accepted as text and authentication should occur normally	If credentials are incorrect, a normal authentication error should be displayed rather than an input validation error.

3. Create a table listing at least 5 exploratory test scenarios you would perform on the Zomato restaurant search feature, including what you would do and what kind of bugs you might expect to find.

Ans.

Scenario	Test Activity	Possible Bugs Expected
Search by restaurant name	Search using exact and partial names	Missing or incorrect search results
Search with spelling mistakes	Example: "Dominos" vs "Domino's"	Poor typo tolerance or no suggestions
Search using emojis or special characters	Enter emojis or symbols	Search crash, incorrect results, or UI issues
Search while changing location	Switch delivery location and search again	Restaurants from the previous location may still appear
Rapid searches	Perform multiple searches quickly	Slow response, stale results, duplicate requests, or incorrect suggestions

4. Perform exploratory testing on the Paytm recharge flow (up to the payment screen, do not actually pay) and write a short report describing your testing approach, any bugs or usability issues found, and suggestions for improvement.

Ans.

Objective :-

Evaluate the recharge flow from entering the mobile number up to the payment screen, focusing on usability, validation, and potential user confusion.

Test Approach :-

- Enter valid and invalid mobile numbers.
- Check validation messages.
- Observe loading indicators and error handling.
- Stop testing before completing payment.

Example Areas to Examine :-

- Mobile number validation
- Operator detection
- Circle/region selection

Area	Observation	Suggestion
Mobile Number	Validation message may not clearly explain the error.	Use more descriptive messages (e.g., "Enter a valid 10-digit mobile number").
Loading	Users may not know whether operator detection is still in progress.	Show a visible loading indicator.
Recharge Amount	Invalid amounts may only be detected after proceeding.	Validate the amount immediately while typing.
Payment Screen	Too many payment options may overwhelm new users.	Highlight recently used or recommended payment methods first.
Navigation	Going back may clear previously entered information.	Preserve user input when navigating back.

Suggestions for Improvement :-

1. Provide clearer validation messages.
2. Display loading indicators during network requests.
3. Preserve user-entered data when navigating back.
