

ASSIGNMENT 2

- **SESSION 17**

1. create a smoke test checklist for the login and dashboard features of a food delivery app like Zomato, listing at least 5 key test cases that would quickly verify if the main flows work after a new build.

Ans.

Smoke Test Checklist – Login & Dashboard (Zomato)

Test case ID.	Test case	Expected result
ST-01	Launch the application App	opens successfully without crashing.
ST-02	Login with valid credentials	User logs in successfully and is redirected to the dashboard.
ST-03	Login with invalid credentials	Appropriate error message is displayed.
ST-04	Verify dashboard loads after login	Dashboard displays restaurants, offers, and user details correctly.
ST-05	Verify search bar on dashboard	Restaurants are displayed without loading errors.

2. Write a sanity test scenario for the 'Add to Cart' feature in a Flipkart-style shopping app, focusing only on verifying a recent bug fix without retesting unrelated functionality. Your scenario should be limited to confirming the specific fix works as expected.

ANS.

Sanity Test Scenario :- Add to Cart

Sanity Test Scenario

1. Open the shopping app and log in.
2. Navigate to any product page.
3. Click the "Add to Cart" button.
4. Verify the selected product is added to the cart successfully.
5. Open the cart and confirm the correct product is listed.

Expected Result :- The selected product is successfully added to the cart, the cart count updates correctly, and the product appears in the cart. No unrelated features (such as checkout or payment) are tested.

3. Compare smoke testing and sanity testing by creating a table with at least 4 differences, using examples from popular apps like Instagram or Paytm to illustrate each point.

ANS.

SMOKE TESTING	SANITY TESTING
Verifies that the application's critical features work after a new build.	Verifies a specific bug fix or small change works correctly

Covers major functionalities at a high level.	Covers only the affected functionality in detail.
Performed before detailed testing begins.	Performed after receiving a bug fix or minor update.
Example: In Paytm, check login, wallet access, and payments are accessible.	Example: In Paytm, verify only the fixed QR code payment issue.

4. Given this situation: After a major update, the Spotify app crashes on startup for some users. Decide whether smoke testing or sanity testing is appropriate first, and explain your reasoning in 2-3 lines.

ANS.

Smoke testing should be performed **first**.

Since the app crashes on startup after a major update, the first priority is to verify whether the build is stable and whether critical features work at all. If the smoke test fails because the app cannot start, further testing, including sanity testing, should not proceed until the issue is fixed.
