

ASSIGNMENT 2

- **SESSION 25**

1.Prepare a one-page Test Summary Report for a recent feature update in a food delivery app like Zomato, including sections for test objectives, test coverage, major defects found, and overall test status.

ANS.

Test Summary Report – Food Delivery App (Zomato-style) :-

Test Summary Report :-

Project: Food Delivery App

Feature Tested: Order Tracking & Live Delivery Status Update

Test Cycle: Sprint 8

Test Duration: 5 Days

Prepared By: QA Tester

1. Test Objectives

- Verify the order tracking feature works correctly.
- Validate real-time order status updates.
- Ensure estimated delivery time is displayed accurately.
- Verify notifications are sent for each order status change.

2. Test Coverage

Area Tested	Status
Order Placement	Tested
Live Order Tracking	Tested
Delivery Status Updates	Tested
Push Notifications	Tested
Order Cancellation	Tested
Error Handling	Tested

3. Test Execution Summary

Metric	Value
Total Test Cases	80
Executed	80
Passed	74
Failed	6
Blocked	0

4. Major Defects Found

Defect ID	Description	Severity	Status
BUG-101	Order status not updated after payment	High	Fixed
BUG-102	Estimated delivery time not refreshed	Medium	Fixed
BUG-103	Duplicate push notification received	Low	Open

5. Overall Test Status

- Core functionality tested successfully.
- Most critical defects have been fixed and verified.
- Remaining issues are minor and do not block release.

Overall Status:- Ready for Release (with minor known issues)

2. Create a sample Daily QA Report for a 5-day sprint in a movie ticket booking app (BookMyShow style), listing the number of test cases executed, passed, failed, and blocked for each day.

Ans :-

Daily QA Report – 5-Day Sprint (BookMyShow-style)

Day	Test Cases Executed	Passed	Failed	Blocked
Day 1	20	18	2	0

Day	Test Cases Executed	Passed	Failed	Blocked
Day 2	25	22	2	1
Day 3	30	27	2	1
Day 4	28	25	2	1
Day 5	22	21	1	0

Sprint Summary

Metric	Total
Test Cases Executed	125
Passed	113
Failed	9
Blocked	3

3. List and define five common QA metrics (such as Defect Density, Test Case Execution Rate, Defect Leakage, Test Coverage, and Defect Reopen Rate) and explain how each would be useful for a team testing a digital payments app like Paytm.

Ans.

Common QA Metrics :-

QA Metric	Definition	Usefulness for a Digital Payments App (Paytm-style)
Defect Density	Number of defects per module or size of software.	Identifies modules (e.g., payments or wallet) with the highest number of defects, helping prioritize quality improvements.
Test Case	Percentage of planned	Measures testing progress and indicates

QA Metric	Definition	Usefulness for a Digital Payments App (Paytm-style)
Execution Rate	test cases that have been executed.	whether the sprint is on schedule.
Defect Leakage	Defects discovered after release that were missed during testing.	Evaluates the effectiveness of testing, especially for critical payment and transaction features.
Test Coverage	Percentage of requirements or features covered by test cases.	Ensures important features such as money transfer, recharge, and bill payments are adequately tested.
Defect Reopen Rate	Percentage of defects reopened after being marked as fixed.	Indicates the quality of bug fixes and helps identify areas where fixes require better verification.

4. Given this scenario: In a weekly sprint for a music streaming app (Spotify-style), 120 test cases were planned, 110 executed, 95 passed, 15 failed, and 5 defects were reopened. Calculate the Test Case Execution Rate and Defect Reopen Rate, and interpret what these numbers might indicate.

Ans.

Metric Calculation :-

Given Data

- Planned Test Cases = **120**
- Executed Test Cases = **110**
- Passed = **95**
- Failed = **15**
- Reopened Defects = **5**

Assumption: Total defects found = **15** (equal to the failed test cases, since no separate defect count is provided).

A. Test Case Execution Rate

Formula:

$$\text{Execution Rate} = \frac{\text{Executed}}{\text{Planned}} \times 100$$

Calculation:

$$= \frac{110}{120} \times 100 = 91.67\%$$

Test Case Execution Rate = 91.67%

B. Defect Reopen Rate

Formula:

$$\text{Defect Reopen Rate} = \frac{\text{Reopened Defects}}{\text{Total Defects Found}} \times 100$$

Calculation:

$$= \frac{5}{15} \times 100 = 33.33\%$$

Defect Reopen Rate = 33.33%

Interpretation

- **Test Case Execution Rate (91.67%):** The QA team completed most of the planned testing, but 10 test cases were not executed. The remaining tests should be completed before release to improve confidence in product quality.
- **Defect Reopen Rate (33.33%):** About one-third of the reported defects had to be reopened after being marked as fixed. This suggests that some fixes were incomplete or introduced new issues, indicating a need for stronger developer verification and more thorough regression testing before closing defects.
