

ASSIGNMENT 2

- SESSION 3

1. Draw the V-Model diagram on paper or using any digital tool, and clearly label each phase with both the developer and tester roles involved at each step.

Ans :

2. Pick any app you use daily (like Zomato, Instagram, or Paytm) and write a short table mapping each SDLC phase (Requirement, Design, Coding, Testing, Deployment, Maintenance) to a real activity that would happen for that app.

Ans :

SDLC Phases Mapped to a Daily-Use App (Zomato)

SDLC Phase	Real Activity in Zomato
Requirement	Collect user requirements for features such as restaurant ratings or live Order Tracking.
Design	Create UI designs, database structure, and system architecture for the new Features
Coding	Developers implement the feature, such as adding a "Schedule Order"
Testing	Testers verify that restaurant search, ordering, payment, and order tracking work correctly.
Deployment	Release the updated application on the Google Play Store and Apple
Maintenance.	Fix reported bugs, improve performance, and release feature updates based customer feedback

3. For each phase of the V-Model, list one specific testing activity that should be performed, using examples from a food delivery app (like Swiggy or Zomato). For example, during 'System Testing', you might test if the order placement works end-to-end.

Ans :-

<u>V-Model Phase</u>	<u>Testing Activity (Example: Swiggy/Zomato)</u>
Requirements Analysis	Verify that requirements clearly mention features like food ordering, payment, and live tracking.
System Design	Review the design to ensure order processing, payment gateway, and delivery modules are correctly planned.
High-Level Design	Plan integration testing between restaurant, payment, and Delivery services.
Low-Level Design	Prepare unit test cases for functions like bill calculation and coupon validation.

Integration Testing	Test whether restaurant acceptance, payment confirmation, and order tracking work together correctly.
System Testing	Test the complete order process from selecting food to successful delivery.
Acceptance Testing	Verify that customers can place orders, make payments, track, deliveries and receive notifications as expected.

4. Compare the V-Model and RAD Model by listing 3 strengths and 2 weaknesses of each, focusing on how testing is handled in both models.

Ans :

V-Model :-

Strengths

1. Testing starts early in every development phase.
2. Easy to detect defects before coding progresses.
3. Produces high-quality software with thorough verification and validation.

Weaknesses

1. Difficult to handle changing requirements.
2. Development takes more time because each phase must be completed before moving on.

RAD (Rapid Application Development) Model :-

Strengths

1. Fast development using prototypes.
2. Continuous user feedback improves the product.
3. Testing is performed after each prototype, helping identify issues quickly.

Weaknesses

1. Less suitable for large or complex projects.
2. Frequent requirement changes can make testing repetitive and increase effort.
