

ASSIGNMENT 2

● SESSION 8

1. Pick any one feature from a popular app you use daily (for example: Instagram signup, Flipkart add-to-cart, or Paytm recharge) and write 5 clear requirements for that feature.

ANS.

Selected Feature :- Instagram Login

R.ID Requirement Description

- R1 The user should be able to log in using a valid username/email and password.
- R2 The system should display an error message for invalid login credentials.
- R3 The password field should hide the entered characters by default.
- R4 The "Forgot Password" option should redirect the user to the password recovery page.
- R5 The Login button should remain disabled until both username/email and password fields are filled.

2. For the requirements you wrote in Task 1, create a table mapping each requirement to at least one test case that would verify it works as intended. Your table should have columns: Requirement ID, Requirement Description, Test Case ID, Test Case Description.

Ans.

R.ID	Requirement Description	Test Case ID	Test Case Description
R1	User can log in with valid credentials	TC01	Enter valid email and password and verify successful login.
R2	Show error for invalid credentials	TC02	Enter incorrect password and verify error message is displayed.

R3	Login button enabled only after both fields are filled	TC03	Leave one or both fields empty and the Login button remains disabled.
R4	Redirect to home feed after login	TC04	Log in successfully and verify Navigation the home field.
R5	Password reset functionality	TC05	Click "Forgot Password," enter a registered email, and verify the reset link is sent.

3. Extend your table from Task 2 by adding a 'Defect ID' column.

Imagine that during testing, you find 2 bugs related to your test cases. Link these defects to the relevant test cases in your table. Defects can be things like 'Signup button not enabled' or 'OTP not received.'

Ans.

Requirement ID	Requirement Description	Test Case ID	Test Case Description.	Defect ID
R1	User can log in with valid credentials	TC01	Enter valid username and password and verify successful login.	
R2	Show error for invalid credentials	TC02	Enter an incorrect password and verify the error message is displayed.	D01
R3	Password should be hidden	TC03	Enter a password and verify characters are masked.	

R4	Login button enabled only after both fields are filled	TC04	Leave one field empty and verify the Login button remains disabled.	D02
R5	Redirect to home feed after login	TC05	Log in successfully and verify the user is redirected to the home feed.	

4. Explain in 3-4 sentences the difference between forward traceability and backward traceability in the context of your table. Give one example of each using your requirements and test cases.

Ans.

Forward traceability ensures that every requirement is linked to one or more test cases so that all requirements are tested.

For example, Requirement R4 is linked to TC04, which verifies that the Login button is enabled only after both fields are completed.

Backward traceability ensures that every test case can be traced back to a valid requirement, preventing unnecessary testing.

For example, TC02 traces back to R2, confirming that the test case exists to verify the requirement for displaying an error message when invalid credentials are entered

5. Create a bi-directional RTM (Requirements Traceability Matrix) for the login feature of a food delivery app like Zomato, showing how each

requirement is linked to test cases and how test cases trace back to requirements. Include at least 3 requirements and 5 test cases in your matrix.

Ans.

Requirement ID.	Requirement Description	Linked test Cases	Test case Description	Linked Requirement
R1	be able to log in using a valid mobile number and OTP.	TC_01, TC_02	Verify OTP is sent to a valid mobile number.	R1
R1	User should be able to log in using a valid mobile number and OTP.	TC_01, TC_02	Verify successful login using the correct OTP.	R1
R2	The system should display an error message for an invalid OTP.	TC_03	Enter an incorrect OTP and verify the error message is displayed.	R2
R2	The Login button should remain disabled until the required fields are completed.	TC04, TC05	Verify the Login button is disabled when the mobile number field	R3

			is empty.	
R3	button should remain disabled until the required fields are completed.	TC04, TC05	Verify the Login button becomes enabled after entering a valid mobile number and OTP.	R3
