

Assignment-3 Session 4

Question 4: Suppose you have a users table in your database and the UI shows a new user "Riya" was registered. Write an SQL SELECT query to confirm if "Riya" exists in the users table, and explain what result you would expect if the UI and DB are in sync.

Answer

SQL Query

```
SELECT *  
FROM users  
WHERE name = 'Riya';
```

Alternative (Using Email)

```
SELECT *  
FROM users  
WHERE email = 'riya@example.com';
```

Expected Result

If the registration was successful and the UI and database are synchronized:

The query should return **one record** containing Riya's details.

The returned record may include fields such as:

User ID

Name (Riya)

Email

Mobile Number

Registration Date

Question 5: After deleting a product from your shopping cart in the Flipkart UI, write an SQL query to verify that the product is no longer present in the cart_items table for your user.

Answer

SQL Query

```
SELECT *  
FROM cart_items  
WHERE user_id = 101  
AND product_id = 5001;
```

Example:
user_id = 101
product_id = 5001

Expected Result

After the product is deleted from the shopping cart:

The query should return **0 rows (no records found)**.

This confirms that the product has been successfully removed from the cart_items table.

Verification Table

Scenario	Expected SQL Result
Product successfully removed	No records returned (0 rows)
Product not removed	One or more records are returned
